SECTION 1: DISSERTATION-GRADE TECHNICAL ANALYSIS

This section formalizes the subsystem as a multi-dimensional, multi-invariant emotional-computational construct. The subsystem is modeled using hybridized systems-engineering formalisms, affective-computing state equations, and cognitive-neuroscience transformation rules. Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■, polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

The subsystem is modeled using hybridized systems-engineering formalisms, affective-computing state equations, and cognitive-neuroscience transformation rules. Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■, polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

This section formalizes the subsystem as a multi-dimensional, multi-invariant emotional-computational construct. The subsystem is modeled using hybridized systems-engineering formalisms, affective-computing state equations, and cognitive-neuroscience transformation rules. Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■, polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

The subsystem is modeled using hybridized systems-engineering formalisms, affective-computing state equations, and cognitive-neuroscience transformation rules. Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■, polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

This section formalizes the subsystem as a multi-dimensional, multi-invariant emotional-computational construct. The subsystem is modeled using hybridized systems-engineering formalisms, affective-computing state equations, and cognitive-neuroscience transformation rules. Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■,

polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

The subsystem is modeled using hybridized systems-engineering formalisms, affective-computing state equations, and cognitive-neuroscience transformation rules. Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■, polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

This section formalizes the subsystem as a multi-dimensional, multi-invariant emotional-computational construct. The subsystem is modeled using hybridized systems-engineering formalisms, affective-computing state equations, and cognitive-neuroscience transformation rules. Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■, polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

The subsystem is modeled using hybridized systems-engineering formalisms, affective-computing state equations, and cognitive-neuroscience transformation rules. Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■, polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

This section formalizes the subsystem as a multi-dimensional, multi-invariant emotional-computational construct. The subsystem is modeled using hybridized systems-engineering formalisms, affective-computing state equations, and cognitive-neuroscience transformation rules. Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■, polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

The subsystem is modeled using hybridized systems-engineering formalisms, affective-computing state equations, and cognitive-neuroscience transformation rules. Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■, polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

This section formalizes the subsystem as a multi-dimensional, multi-invariant emotional-computational construct. The subsystem is modeled using hybridized systems-engineering formalisms, affective-computing state equations, and cognitive-neuroscience transformation rules. Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■, polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs

include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

The subsystem is modeled using hybridized systems-engineering formalisms, affective-computing state equations, and cognitive-neuroscience transformation rules. Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■, polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

This section formalizes the subsystem as a multi-dimensional, multi-invariant emotional-computational construct. The subsystem is modeled using hybridized systems-engineering formalisms, affective-computing state equations, and cognitive-neuroscience transformation rules. Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■, polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■, polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

This section formalizes the subsystem as a multi-dimensional, multi-invariant emotional-computational construct. The subsystem is modeled using hybridized systems-engineering formalisms, affective-computing state equations, and cognitive-neuroscience transformation rules. Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■,

polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■, polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

This section formalizes the subsystem as a multi-dimensional, multi-invariant emotional-computational construct. The subsystem is modeled using hybridized systems-engineering formalisms, affective-computing state equations, and cognitive-neuroscience transformation rules. Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■, polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■, polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

This section formalizes the subsystem as a multi-dimensional, multi-invariant emotional-computational construct. The subsystem is modeled using hybridized systems-engineering formalisms, affective-computing state equations, and cognitive-neuroscience transformation rules. Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■, polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■, polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

This section formalizes the subsystem as a multi-dimensional, multi-invariant emotional-computational construct. The subsystem is modeled using hybridized systems-engineering formalisms, affective-computing state equations, and cognitive-neuroscience transformation rules. Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■, polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs

include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■, polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

This section formalizes the subsystem as a multi-dimensional, multi-invariant emotional-computational construct. The subsystem is modeled using hybridized systems-engineering formalisms, affective-computing state equations, and cognitive-neuroscience transformation rules. Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■, polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■,

polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

This section formalizes the subsystem as a multi-dimensional, multi-invariant emotional-computational construct. The subsystem is modeled using hybridized systems-engineering formalisms, affective-computing state equations, and cognitive-neuroscience transformation rules. Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■, polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■, polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

This section formalizes the subsystem as a multi-dimensional, multi-invariant emotional-computational construct. The subsystem is modeled using hybridized systems-engineering formalisms, affective-computing state equations, and cognitive-neuroscience transformation rules. Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■, polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

Emotional-state propagation occurs through deterministic and semi-stochastic transition paths

encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

This section formalizes the subsystem as a multi-dimensional, multi-invariant emotional-computational construct. The subsystem is modeled using hybridized systems-engineering formalisms, affective-computing state equations, and cognitive-neuroscience transformation rules. Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■, polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

This section formalizes the subsystem as a multi-dimensional, multi-invariant emotional-computational construct. The subsystem is modeled using hybridized systems-engineering formalisms, affective-computing state equations, and cognitive-neuroscience transformation rules. Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■, polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

This section formalizes the subsystem as a multi-dimensional, multi-invariant emotional-computational construct. The subsystem is modeled using hybridized systems-engineering formalisms, affective-computing state equations, and cognitive-neuroscience transformation rules. Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■, polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

The subsystem is modeled using hybridized systems-engineering formalisms, affective-computing state equations, and cognitive-neuroscience transformation rules. Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■, polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

This section formalizes the subsystem as a multi-dimensional, multi-invariant emotional-computational construct. The subsystem is modeled using hybridized systems-engineering formalisms, affective-computing state equations, and cognitive-neuroscience transformation rules. Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■, polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs

include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

The subsystem is modeled using hybridized systems-engineering formalisms, affective-computing state equations, and cognitive-neuroscience transformation rules. Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■, polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

This section formalizes the subsystem as a multi-dimensional, multi-invariant emotional-computational construct. The subsystem is modeled using hybridized systems-engineering formalisms, affective-computing state equations, and cognitive-neuroscience transformation rules. Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■, polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■, polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.

This section formalizes the subsystem as a multi-dimensional, multi-invariant emotional-computational construct. The subsystem is modeled using hybridized systems-engineering formalisms, affective-computing state equations, and cognitive-neuroscience transformation rules. Each computational element is defined via symbolic operators governing emotional-state vectors E(t), temporal distortion tensors $\Delta\tau$, narrative-transition functions N(x), cluster excitation matrices C■■, polarity-field coefficients Π, shadow-activation variables S(k), and adaptive-governor constraints G(λ, μ). Emotional-state propagation occurs through deterministic and semi-stochastic transition paths encoded via the Genesis OS Temporal Engine, which imposes emotional-physics invariants describing residue decay, drift velocity, entropy modulation, and cognitive-emotional coupling. Subsystem outputs include high-dimensional emotional signatures, reconstructed narrative topologies, resonance-field alignment indices, and compliance-gated adaptive-learning thresholds. The subsystem integrates into the Genesis OS as a co-regulated node in a hierarchical emotional-intelligence architecture providing forward- and backward-propagating emotional-governance signals across all processing layers.
